

Supply-Chain Situation Report

Report type: Point-in-time (PIT) — 2021-03-30 08:00 UTC **Information cutoff:** 2021-03-30 08:00 UTC. This report is strictly point-in-time: it reflects only signals received on or before the cutoff. No post-cutoff data, hindsight, or future market outcomes inform any score, projection, or precedent shown.

[SEVERE] Suez Canal — composite 0.76

Lead source: Suez Canal Authority (govt_advisory) <https://www.suezcanal.gov.eg>

Corroboration: 49 signals, 9 source types | **Region:** middle_east | **Market lens:** semicon **Relevance to semicon:** 0.3 / 1 (cosine similarity, signal text vs market context)

Weather Disruption Index (WDI)

44 / 100 — ORANGE

Block	Factor	Raw (0-10)	Weight
Severity	intensity	8.5	0.40
Severity	radius	10.0	0.20
Severity	duration	1.7	0.40
Severity total		6.1	
Vulnerability	concentration	10.0	0.40
Vulnerability	inventory buffers	3.7	0.20
Vulnerability	utility dependency	6.3	0.40
Vulnerability total		7.3	
WDI = severity × vulnerability		6.1 × 7.3	44

Historical precedents

Event	Date	Match	Documented insured impact	Weight
Suez Crisis canal closure	1956-10-29	0.46	—	w=0.46
Tianjin port explosion	2015-08-12	0.30	\$3,500M	w=0.30
Texas Winter Storm Uri fab shutdowns	2021-02-14	0.17	\$360M	w=0.17

Projected insured impact

Match-weighted mean of documented analog losses: **\$2,338M** (precedent range \$360M–\$3,500M; each weight is the row's match score above). **EXCEEDS** the PCS \$25M catastrophe-designation threshold.

Recommended insurer actions

- **Declare CAT readiness now:** initiate PCS-style catastrophe tracking for the affected region — spin up a dedicated claims serial number and reserve committee review before policyholder volume spikes.
- **Claims capacity:** pre-stage adjusters and surge call-center staffing for the footprint; expect first notices of loss within 24–72h of the exposure event.
- **Underwriting hold:** pause new-binding authority in the affected geography/sector pending loss confirmation.
- **Reinsurance notification:** projected \$2,338M clears the PCS \$25M designation line — notify reinsurance partners and verify attachment-point availability for the exposed portfolio.
- **Portfolio triage:** proximity-ranked watchlist — Suez Canal, Port of Iskenderun, Ceyhan oil terminal. Pull exposure reports and flag concentration above retention thresholds for proactive outreach/mitigation.

How we scored this

- 49 signals from 36 distinct sources; hazard composite 0.76 via rubric (type/proximity/corroboration/spread/escalation).
- Exposure = distance-decayed chokepoint criticality; vulnerability = sector-resilience prior per node kind.
- Analogs picked by mechanism/sector/geo similarity; projected loss = match-weighted mean of documented analog losses, scaled by severity ratio (capped 0.33–1.5×).
- Caveat: automated early-warning signal, not underwriting advice. Replay data is curated and point-in-time; projections are analog-derived estimates, not observed outcomes.
